

These coil assemblies are used for the construction of RF coils. In the pictures are shown all the parts included in a single kit. All coil assemblies include the tuning core (usually already provided, or provided separately).

Composition and footprint	description	cod.	price € each 1 - 10+ pcs
	shield: 10 mm support: 5 pins 10 mm with ferrite core	SBK-10F	1,05 - 0,95 0,85 / 100 pcs
<p>the coil support has 2 rings to lean the cup core</p> <p>the cup core is inserted by a byonet coupling mechanism</p>  <p>cup core mounted on support</p> <p>The winding is made within the 2 rings</p>	shield: 10 mm support: 5 pins 10 mm with ferrite core the cup core is used to improve Q , inductance and shielding.	SBK-10SCH	1,30 - 1,15 1,05 / 100 pcs
	support: Ø 4 mm without pins with ferrite core	SBK-01N	0,40 - 0,35

INTRODUCTION TO OUR VARIABLE COILS

All these coils have been tested and characterized with our instrumentation: HP 4191A 1-1.000 MHz impedance analyzer, HP 4342A 22 KHz - 70 MHz precision Q meter and Racal 9383M RLC bridge.

Q value is referred to the measurement conditions (frequency and inductance values) and it is measured about at half of the inductance range.

The electrical diagram has to be viewed by the pin side, it is also available the number of turns. The picture shows the complete coil and all its parts, the picture is nearly in 1:1 scale and it shows quite the real size of the coil.

Coils with a parallel capacitor have also the auto-resonance value in MHz due to the internal capacitor, for these coils the maximum frequency is that stated, while the minimum frequency can be decreased by adding an external capacitor.

“MOLDED” indicates a different way of manufacturing of these coils, they are rugged, the turns are winded on a polypropylene support more resistant either to soldering and to mechanical torque and they are often use for VHF - UHF band, in “molded” coil the support has the purpose to keep the turns stable and separate to obtain the highest possible Q and thermal stability.

The “□” symbol indicates the coil external size while in the picture there is the pins pitch.

After a long work of research of technical specifications, we believe that this can be an helpful aid in choosing a component that fits as possible different projects.

The tests results have been collected directly in our lab so the specifications are often more complete than those provided by the manufacturers.

They are coils and / or transformers often used in the amplification of intermediate frequency receivers for AM, FM, etc.. , Intermediate frequency values are 455 / 460 KHz, 10.7 MHz and 5.5 MHz too. Each coil is supplied with shield and tuning ferrite core, choose design represented by the letter A to J according your application (see pictures).

These coils are wound on an insulate threaded support and they have the following advantages: mechanically rugged, high thermal stability and high repeatability as the turns are forced to remain wrapped within the thread and winded tight and hot made. They have high Q, low parasitic capacity and high SRF, each coil was tested in our laboratory, the Q was measured at a given frequency and shown in "MHz" column.

SPECIAL Inductances : high SRF , for BIAS - T , QPL and ultra-stable

These inductors for microwave have high SRF and very good QPL, they are stable in temperature so they are used for very critical functions like BIAS T or "decoupling on power supply". BIAS T does not come cheap or easy to build, the aim is to supply power to an RF device like broadband MMIC, low noise amp., switch, pin or tuning varactor etc.. The difficulty is to select critical components, C and L, free from parasitic resonances within a wide frequency range (3-5 decades), technicians well know the importance of good decoupling in amplifiers and high performance active devices. One rule is to reduce the size, in fact, two of these inductors have an SRF > 15 GHz, another inductances can be inserted in order to obtain the desired value. They can be considered as a complementary component of beam-lead capacitors, the size is so small that the similarity is almost appropriate.

impedance vs. frequency

note that for the construction of this type of impedance (RF choke for HF-VHF-UHF) are available a variety of ferrite rods, for example. types BF1 and BF2. It is possible to build a custom RF choke with an enamelled copper wire winding .

see ferrite rods types BF....

They are SMD inductors used as general purpose choke to supply power or to decouple RF parts of the power supply, for Bias T etc... for low and medium current. For applications such as RF matching, oscillating circuits (eg VCO) or resonant circuits, it is most recommended to use high-Q inductors described on the next pages.

These inductances are used where are required better RF or microwave performances, for example, a higher frequency of self resonance (SRF), or a better Q, or both, with better accuracy and repeatability, they are therefore to be used in VCO, oscillating or resonating circuits, RF filters, matching circuits, etc..

We inform our kind customers that are available silver unipolar teflon coated wires useful to build inductances and transformers on toroids, see end of section J "cables".

Amidon toroids are often used for high Q narrow-band tuned circuits in the specified frequency or for wide band not tuned circuits on a much larger bandwidth than specified.

These Amidon toroids are often used for broadband not tuned circuits, for example as transformers in Norton circuits, as component for power splitters, dividers or combiners, HF balun, for input or output matching, on HF - VHF power amplifiers, on high impedance IF filters, etc.. Moreover, for their characteristics of medium-high inductance, they are also used to build decoupling choke coils, power supply EMI filters, etc.. because they could reach high inductance values.

EXAMPLES of HF – VHF hybrid couplers made with Amidon toroids FT....- 43 series

Dividers-combiners @ - 3 dB

with 2 pcs of FT...-43 toroids
1 - 30 MHz high insulation
very good return loss

Hybrid @ - 6 dB

with 1 pc of FT...-43 toroid
1 - 200 MHz high insulation
adequate return loss

We inform our kind customers that are available silver plated unipolar wires with teflon insulation useful to build inductances and transformers on toroids, see end of section J "cables".

EXAMPLES OF POWER HF - VHF TRANSFORMERS

We inform our kind customers that are available silver plated unipolar wires with teflon insulation useful to build inductances and transformers on toroids, see end of section J "cables".

Skilled and unusual process for to build HF power transformer

Following the instructions below it is possible to build a very good HF power transformers without using difficult to find brass or copper pipes . This technique is suitable for almost any toroid hole size. The instructions can be used for high or medium power RF transformers using single or binocular ferrites. In particular this method is useful for 1:4, 1:9, 1:16 etc... transformers where the 1 side uses the technique show and the 4, 9, 16 etc side is made using further turns inserted into the inside of the shield .

RG213 - 214 ecc...

Save from RG213, 214 etc... coaxial cable 10 cm of its shield, can be used also RG58, 59, 142 etc.. for ferrites with small holes.

For these 2 ferrites (see picture), even if they have a very different size holes, we used the same shield saved from RG213 because the size of the shield is not critical.

Insert the shield into the ferrite and into the shield insert any round object to prevent the shield from deforming .

Use an awl to widen the holes at the ends of the shield, to insert any further cables if needed. When finished, as you can see in the picture , insert the teflon wire into the shield for the second winding completing the transformer.
